Health Priorities Identification Note

- **Top priority:** The one thing to focus on addressing is hand pain and fatigue, so that I can achieve a goal to watch my grandchildren for at least 60 minutes over the next 4 weeks, in line with my value of staying connected to my family.

- **Goal attainment scaling** developed on 04/03/2026:

Scale	Worse	Current status	Realistic goal	Stretch goal	Super stretch goal
Goal	Able to watch grandchildren for *15 minutes or less* before stopping due to hand pain or fatigue.	Able to watch grandchildren for *between 16 and 59 minutes* before stopping due to hand pain or fatigue.	Able to watch grandchildren for *at least 60 minutes* without stopping due to hand pain or fatigue.	Able to watch grandchildren for *at least 90 minutes* without stopping due to hand pain or fatigue.	Able to watch grandchildren for *at least 120 minutes* without stopping due to hand pain or fatigue.

- What matters most (Values):
  - Connecting: Values being actively involved in her grandchildren's lives and maintaining strong family relationships.
  - Enjoying Life: Enjoys meaningful, interactive time with family and feeling engaged rather than limited by pain or fatigue.
  - Functioning: Values independence and maintaining enough hand function and stamina to stay active and involved.

- Most important health outcome goal (The specific activity you most want to do that is realistic and doable with your health care): I want to watch my grandchildren for at least 60 minutes at a time over the next 4 weeks without having to stop because of hand pain or fatigue.

- Current bothersome symptoms or health problems: Hand pain, fatigue

- Current burdensome health care tasks and medications: Managing multiple daily medications; using CPAP; attending frequent medical appointments.

If you make any recommendations based on patient priorities please use this phrase/smart phrase: "Based on the patient's top priority, we made the decision to ( )."
